Wood-Tick - scientific name Ixodes

The wood-tick is a parasite commonly found in damp grass, shrubs and rubbish. and often trouble persons walking and camping in the woods. Some wood-ticks cause "Rocky Mountain fever" which causes a few deaths each year.

The adult tick has eight legs that cling tightly to their host. Their feelers appear to move constantly and are always ready to attach to anything that has blood and moves. They also appear to have heat detectors, a good smelling sense and good vision. The wood tick will attack it's self to most fur-bearing animals in western Canada and is often seen on domestic

animals including pets.

Most petroleum products can be used to remove wood ticks. The odor causes them to move. Their air intakes are on the side of their body and a small amount of the petroleum product applied near the air-intake will make the wood tick move and release its hold.

~~Previously submitted~~

The wood tick suit can be designed as a one-piece overall or a two-piece pant and jacket outfit.

Around the ~~elasticized~~^{elasticized} pant cuffs velcro would hold the cuffs in place attaching the cuffs to the ~~elasticized~~^{elasticized} top of the socks. Socks should be pulled over top of the cuffs.

Suitable non toxic sticky material should be attached mid-way between the ankle and knee to prevent the tick from moving upwards or horizontally.

The sticky material should also be attached between the knees and the hips and across the chest and back and on the arms.
